

Byte2Beat

Compete to build solutions to cardiovascular challenges on the frontier on the edge of AI and health.

Overview

Cardiovascular disease remains one of the most complex and devastating health problems. In this hackathon, you'll use real data to build machine learning models that support early detection, progression forecasting, or interpretability of risk factors.

Our goal: make serious computational health innovation accessible to every motivated high school or undergraduate student, no lab or insider network required.

Hack4Health democratizes computational medicine by giving students access to authentic biomedical datasets, pragmatic tooling, and strong mentorship.

Description

Participants in this hackathon are encouraged to seek out new research ideas for themselves for better research taste experience. However, for an easier introduction to the vast realm of research, at our discord at <https://discord.com/invite/SZhaZcNh4D>

Guidelines

In this hackathon, participants will develop research questions as the edge of the intersection between AI and health.

We emphasize and encourage creative freedom, but have an extensive idea list on our discord.

Please bookmark this link as it is the official competition resource

folder: <https://drive.google.com/drive/folders/1oTqMR3AM3FGjnAXPZZuqDLH7D4rcOhNb>

There, you will find the rules, guidelines, and sample datasets. For stellar projects, please try to find your own dataset.

Submission Requirements

A valid submission must contain the following:

1. Kaggle Writeup

1. Attached Public Notebook

2. Attached Project Link

2. Written report/manuscript

Your final Submission must be made prior to the deadline. Any un-submitted or draft Writeups by the hackathon deadline will not be considered by the Judges.

To create a new Writeup, click on the "New Writeup" button [here](#). After you have saved your Writeup, you should see a "Submit" button in the top right corner.

Note: If you attach a private Kaggle Resource to your public Kaggle Writeup, your private Resource will automatically be made public after the deadline.

1. Kaggle Writeup

The Kaggle Writeup serves as your project report. This should include a title, subtitle, and a detailed analysis of your submission. You must select a Track for your Writeup in order to submit.

Your writeup should clearly document your process. It can be in a research paper style-format, but we encourage more honesty, for example explaining what did not work, and what modifications enabled success.

a. Public Notebook

Your code should be submitted as a public notebook in the **Project Files** field. Your notebook should be publicly accessible and not require a login or paywall. If you use a private Kaggle Notebook, it will automatically be made public after the deadline.

b. Public Project Link

A URL to your working product or interactive demo. This allows judges to experience your project firsthand, if applicable. It should be publicly accessible and not require a login or paywall. If a live demo is not feasible, a link to your public code repository (e.g., GitHub) is required, including detailed setup instructions. If you want to be eligible for the cash prizes, you must utilize Coder in your submission demo (guide on our discord), as Coder is generously sponsoring all the amazing innovators of this hackathon.

Evaluation

Application: Evaluation Rubric (60 points total)

Criteria	Points Possible
Usefulness: The project has a meaningful purpose and connections.	0-15 points
Informativeness: The application includes detailed and accurate documentation.	0-15 points
Documentation Quality: The project is well-documented and follows best practices.	0-15 points
Novelty: The research demonstrates a surprising, new, or novel use case.	0-15 points
